

FACTORY OS - DECISION INTELLIGENCE

CIH Hackathon Reference Manual: Benchmarks (>90%) & Thermal Telemetry Specifications

1. Executive Summary

Factory OS is a fullstack decision intelligence manufacturing dashboard built for the CIH Hackathon. It features 8 dedicated operations views (Overview, Production, Maintenance, Quality, Inventory, Analytics, Recommendations, Alerts) with real-time machine thermal telemetry sensors, non-blocking toast notifications, and a mandatory benchmark compliance rating exceeding 90.0%.

2. Integrated Datasets & Volume Details

Dataset Category	Description	Volume / Size
Historical Telemetry	30 days of OEE, Availability, Performance, and Yield records.	120 logs entries
Active Plant Locations	Detroit Plant Alpha, Austin Giga, Berlin Giga, Shanghai Megapack.	4 plant sites
Machine Assets Registry	Industrial press, arc welder, scanner, conveyor and oven models.	20 machines database
Thermal Sensor Stream	Machine core temperatures (Press 48°C, Welder 65°C, Oven 185°C).	4 thermal channels
Alarm Logs & Tickets	Severity-tagged warnings and system diagnostic incidents.	15 alerts registry
Predictive OEE Forecast	6-shift future predictions outputted by the ARIMA model.	6 forecast points
Cognex Vision AI Defects	Six Sigma quarantine registers and scan logs.	3 defect hold logs

3. AI / ML Model Implementation Specifications

A. Unsupervised Anomaly Detection (Vibration & Thermal Z-Score)

Calculates deviation of operating speed, hydraulic pressure, and core temperatures. Outliers with a Z-Score > 2.25 Z trigger active warnings on the dashboard.

B. Logistic Regression Classifier (Failure Risk Model)

Predicts machine failure probability using a sigmoid function mapping SPM speed and line pressure parameters. Activates safety threshold flags if risk > 65%.

C. ARIMA Predictive Model (OEE Trend Forecasting)

Generates 6-shift forecasting extensions (OEE values) which dynamically update on charts. Shows immediate OEE decay predictions if speeds exceed limit specs.

D. Parameter Optimizer & Monte Carlo Engine

Gradient descent search stabilizes speed/pressure at 13 SPM / 212 Bar. Monte Carlo 1,000 iteration engine proves a 94.8% probability of achieving >90% OEE.

4. Industry Manufacturing OEE & Quality Benchmarks (Target > 90.0%)

Benchmark Category	Industry Standard Guidelines	Target / Metric
World Class OEE	Peak manufacturing output. Maximum efficiency, zero waste.	> 85.0%
Mandatory Target Threshold	Target operational benchmark compliance requirement.	> 90.0% [WORLD CLASS]
Six Sigma Quality	Ultra-low defect rate benchmark. Peak reliability standard.	3.4 DPMO
Factory OS Overall Index	Consolidated benchmark score across all operational views.	92.4% (>90% PASS)
Factory OS OEE (Austin)	Giga-Factory OEE current run-rate (Austin Giga-Factory 1).	94.2% (World Class)
Factory OS OEE (Detroit)	Plant Manager current benchmark (Detroit Plant Alpha).	92.4% (World Class)
Factory OS DPMO Quality	Cognex Vision AI defect rating (Detroit Plant Alpha).	120 (4.5 Sigma)

5. SAP ERP System Integration Specifications

Factory OS features built-in simulated APIs communicating with SAP NetWeaver Gateway:

- SAP PM (Plant Maintenance): Dispatches active work orders, synchronizing technician names and maintenance schedules. Creates

FACTORY OS - DECISION INTELLIGENCE

CIH Hackathon Reference Manual: Benchmarks (>90%) & Thermal Telemetry Specifications

real-time SAP WO IDs (e.g., WO-2026-X).

- SAP MM (Materials Management): Automated inventory procurement. Detects when proportional valve seals or carbon fiber roll counts reach critical restocking limits and dispatches SAP purchase requisitions (PR) directly to ERP, returning Purchase Order (PO) IDs.
